Python for Informatics

Assignment 7

"Google Geocoding"

Description:

1. Change either the geojson.py or geoxml.py program to print out the two-character country code from the retrieved data.
2. Add error checking so your program does not traceback if the country code is not there.
3. Use the program to search for "Pacific Ocean" and make sure that it can handle locations that are not in any country.

Deliverable:

Two files as attachments at our course shell assignment page. The first file should be the Python **.py** that you chose to modify. The second file should be a screenshot image file (.png or .jpg) demonstrating the correct execution of your program. Please ensure that your full name is specified as a Python comment at the top of the **.py** file.

Submission Deadline:

Please see the course schedule in our syllabus for all assignment submission deadlines.
